6 November 1944.

My dear Dr. Moore:

Here's some clñical data on Ross. The man came to the lab claiming he felt that a relapse was coming on. He was a Pharmacists' Mate on the staff, so he did not turn in. He acquired malaria in the SW Pacific about a year and a half ago, and has presented the classic~~al~~ picture of B.T. malaria with diminishing relapses. He had had previous quinine atebrine therapy. This attack was his most severe, and the average parasite count was 30 per field which is approximately equivalent to 12000 per cumm². The f~~o~~llowing show the times at w~~h~~ich smears were taken². They are stained with Giemsa, the thin smears being fixed with absolute methanol before stng.

#1.	23 Sept 1944	1430.	Rin g stages
#2.	24 Sept 1944	1430	Late trophozoites
#3.		1600	gametocytes, early to middle schizonts
#4.		1700	gametocytes, schizonts, merocytes, rings
#5.		1900	All stages. Chill: beginning of paroxysm
#6.		2000	All stages. Fever. Patient acutely ill.

P.S. He's OK now. Please keep personal data confidential.

Sincerely yours,

~~Thx~~

Joshua.
Josh.

The other slides are representative heavy infestations. I've forgotten what stages you can expect.
